1 Introduction

Many-particle ($\# = 5, 6, \dots$) processes are important at LHC and ILC, but only very few processes accurately known:

- $2 \rightarrow 3$ processes

$$e^+e^- \rightarrow \nu\bar{\nu}H, t\bar{t}H, e\bar{e}H, ZHH, \nu\bar{\nu}\gamma, \quad \gamma\gamma \rightarrow t\bar{t}H$$

NLO EW/QCD: GRACE-loop, Denner et al., You et al., Chen et al., Zhang et al. '02-'04

$$pp \rightarrow 3\text{jets}, \gamma\gamma+\text{jet}, V+2\text{jets}, t\bar{t}H, b\bar{b}H, b\bar{b}V$$

NLO QCD: Bern et al., Kunszt et al., Kilgore/Giele, Campbell et al., Nagy, Del Duca et al., Campbell/Ellis, Beenakker et al., Dawson et al., S.D. et al. '96-'05

- $1 \rightarrow 4$ processes

$$H \rightarrow 4 \text{ fermions:}$$

NLO QED

NLO EW

Experimental priority list

- Note have to specify how inclusive final state is
 - ▲ what cuts will be made?
 - ▲ how important is b mass for the observables?
 - How uncertain is the final state?
 - ▲ what does scale uncertainty look like at tree level?
 - ▲ new processes coming in at NLO?
 - Some information may be available from current processes
 - ▲ $pp \rightarrow tT j$ may tell us something about $pp \rightarrow tT bB$?
 - ▲ $j = g \rightarrow bB$
 - ▲ CKKW may tell us something about higher multiplicity final states
1. $pp \rightarrow WW \text{ jet}$
 2. $pp \rightarrow tT bB$
 1. background to tTH
 3. $pp \rightarrow tT + 2 \text{ jets}$
 1. background to tTH
 4. $pp \rightarrow WWbB$
 5. $pp \rightarrow V V + 2 \text{ jets}$
 1. background to $WW \rightarrow H \rightarrow WW$
 6. $pp \rightarrow V + 3 \text{ jets}$
 1. general background to new physics
 7. $pp \rightarrow V V V$
 1. background to SUSY trilepton

Beyond the SM Workshop at Columbia

Complications in corrections to many-particle processes

- huge amount of algebra, long final expressions
 - ↳ **computer algebra / automatization**
- multi-dimensional phase-space integration
 - ↳ **Monte Carlo techniques**
- complicated structure of singularities and matching of virtual and real corrections
 - ↳ **subtraction and slicing techniques**
- treatment of unstable particles, issue of complex masses
 - ↳ **“complex-mass scheme”** recently proposed for higher orders
Denner, S.D., Roth, Wieders, '05
- **numerically stable evaluation of one-loop integrals** with up to 5,6,... external legs
 - ↳ **subject of this talk**

Some comments on one-loop techniques:

- **Reduction techniques:** tensors \rightarrow scalar integrals = basis integrals
proposed by **Brown/Feynman '52**
systematically worked out by **Passarino/Veltman '79**
subsequently modified by many authors
Stuart et al. '88/'90; v.Oldenborgh/Vermaseren '90; Ezawa et al. '92; Denner '93; Campbell et al. '96;
Devaraj/Stuart '97; GRACE-loop '03; del Aguila/Pittau '04; v.Hameren et al. '05; Denner/S.D. '05
- **Reduction techniques:** tensors \rightarrow integrals in $D \neq 4$ dimensions
proposed by **Davydychev '91** and further developed by others
Bern et al. '93; Tarasov '96; Fleischer et al. '99; Binoth et al. '99/'05; Duplancić/Nižić '03;
Giele et al. '04; R.K.Ellis et al. '05
master integrals for massive case missing
- **Reductions for $N \geq 5$ using $D \rightarrow 4$**
proposed by **Melrose '65** for scalar integrals
subsequently generalized to tensors by other authors
v.Neerven/Vermaseren '84; v.Oldenborgh/Vermaseren '90; Campbell et al. '96; Davydychev '91;
Bern et al. '93; Denner '93; Suzuki et al. '02; Tramontano '02; Denner/S.D. '02/'05; GRACE-loop '02/'03
- **Numerical techniques**
various proposal by several authors
but not yet successfully applied to complicated physical processes
Ferrogli et al. '02; Binoth et al. '02/'05; Nagy/Soper '03
de Doncker et al. '04; Kurihara/Kaneko '05; Denner/S.D. '05

2 Preliminaries and Passarino–Veltman reduction

General N -point one-loop tensor integrals of rank P

N denominator factors $1/N_k$:

$$N_k = (q + p_k)^2 - m_k^2 + i\epsilon, \quad p_0 = 0$$

$$k = 0, \dots, N - 1$$

Integral definition:

$$T^{N, \mu_1 \dots \mu_P} = \frac{(2\pi\mu)^{4-D}}{i\pi^2} \int d^D q \frac{q^{\mu_1} \dots q^{\mu_P}}{N_0 N_1 \dots N_{N-1}} \quad (A \equiv T^1, B \equiv T^2, C \equiv T^3, \text{ etc.})$$

Decomposition of tensor integral into covariants:

$$T^{N, \mu_1 \dots \mu_P} = \sum_{i_1, \dots, i_P=1}^{N-1} p_{i_1}^{\mu_1} \dots p_{i_P}^{\mu_P} T_{i_1 \dots i_P}^N + \sum_{i_3, \dots, i_P=1}^{N-1} \{g^{\mu_1 \mu_2} p_{i_3}^{\mu_3} \dots p_{i_P}^{\mu_P} + \dots\} T_{00i_3 \dots i_P}^N$$

$$+ \sum_{i_5, \dots, i_P=1}^{N-1} \{g g p \dots p\}_{i_5 \dots i_P}^{\mu_1 \dots \mu_P} T_{0000i_5 \dots i_P}^N + \dots$$

↪ **Aim:** calculate **tensor coefficients** $T_{i_1 \dots i_P}^N$, **etc.** in terms of few basis integrals

Basic relations among coefficients upon “contraction and cancellation”:

(i) Contraction with momenta

$$2p_k q = \underbrace{[(q + p_k)^2 - m_k^2]}_{=N_k} - \underbrace{[q^2 - m_0^2]}_{=N_0} - \underbrace{[p_k^2 - m_k^2 + m_0^2]}_{\equiv f_k}$$

↪ relation between tensors [“(k)” means propagator denominator N_k omitted]

$$2p_k^{\mu_1} T_{\mu_1 \dots \mu_P}^N = T_{\mu_2 \dots \mu_P}^{N-1}(k) - T_{\mu_2 \dots \mu_P}^{N-1}(0) - f_k T_{\mu_2 \dots \mu_P}^N$$

↪ relation between coefficients [“ \hat{i} ” means index i omitted]

$$\sum_{m=1}^{N-1} 2(p_k p_m) T_{m i_2 \dots i_P}^N + 2 \sum_{r=2}^P \delta_{k i_r} T_{00 i_2 \dots \hat{i}_r \dots i_P}^N + f_k T_{i_2 \dots i_P}^N = (T^{N-1} \text{ terms})$$

(ii) Contraction with metric tensor

$$q^2 = \underbrace{[q^2 - m_0^2]}_{=N_0} + m_0^2$$

↪ relation between tensors

$$g^{\mu_1 \mu_2} T_{\mu_1 \mu_2 \dots \mu_P}^N = T_{\mu_3 \dots \mu_P}^{N-1}(0) + m_0^2 T_{\mu_3 \dots \mu_P}^N$$

↪ relation between coefficients

$$\sum_{n,m=1}^{N-1} 2(p_n p_m) T_{n m i_3 \dots i_P}^N + \text{const.} \times T_{00 i_3 \dots i_P}^N - 2m_0^2 T_{i_3 \dots i_P}^N = (T^{N-1} \text{ terms})$$

Passarino–Veltman reduction

Basic relations yield recursive solution for tensor coefficients:

$$T_{00i_3\dots i_P}^N \propto 2m_0^2 \underbrace{T_{i_3\dots i_P}^N}_{\text{rank } P-2} + \sum_{n=1}^{N-1} f_n \underbrace{T_{ni_3\dots i_P}^N}_{\text{rank } P-1} + (T^{N-1} \text{ terms}),$$

$$T_{i_1\dots i_P}^N = \sum_{n=1}^{N-1} (Z^{-1})_{i_1 n} \left[-f_n \underbrace{T_{i_2\dots i_P}^N}_{\text{rank } P-1} - 2 \sum_{r=2}^P \delta_{ni_r} \underbrace{T_{00i_2\dots \hat{i}_r\dots i_P}^N}_{\text{rank } P-1} + (T^{N-1} \text{ terms}) \right], \quad i_1 \neq 0$$

↪ recursive calculation of $T_{i_1\dots i_P}^N$ from scalar integral T_0^N and $T_{i_2\dots i_P}^{N-1}$:

$$T_0^N = \text{basis integral} \quad \rightarrow \quad T_{i_1}^N \quad \rightarrow \quad T_{i_1 i_2}^N \quad \rightarrow \quad T_{i_1 i_2 i_3}^N \quad \rightarrow \quad \dots$$

But: relations involve inverse Z^{-1} of Gram matrix $Z = \begin{pmatrix} 2p_1 p_1 & \dots & 2p_1 p_N \\ \vdots & \ddots & \vdots \\ 2p_N p_1 & \dots & 2p_N p_N \end{pmatrix}$

↪ potential instabilities for $\det(Z) \rightarrow 0$

Example: 4-point tensor integrals

$$\text{scalar integral} = D_0$$

$$D^\mu = \sum_{i=1}^3 p_i^\mu D_i$$

$$D^{\mu\nu} = \sum_{i,j=1}^3 p_i^\mu p_j^\nu D_{ij} + g^{\mu\nu} D_{00}$$

$$D^{\mu\nu\rho} = \sum_{i,j,k=1}^3 p_i^\mu p_j^\nu p_k^\rho D_{ijk} + \sum_{i=1}^3 \{g^{\mu\nu} p_i^\rho + \dots\} D_{00i}$$

$$D^{\mu\nu\rho\sigma} = \sum_{i,j,k,l=1}^3 p_i^\mu p_j^\nu p_k^\rho p_l^\sigma D_{ijkl} + \sum_{i,j=1}^3 \{g^{\mu\nu} p_i^\rho p_j^\sigma + \dots\} D_{00ij} + \{g^{\mu\nu} g^{\rho\sigma} + \dots\} D_{0000}$$

$$\vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots \qquad \qquad \qquad \vdots$$

3 A seminumerical method for 3- and 4-point integrals

Alternative form of basic PV relations: example of 4-point functions

$$\underbrace{\begin{pmatrix} 2m_0^2 & f_1 & f_2 & f_3 \\ f_1 & | & - & - \\ f_2 & | & Z & \\ f_3 & | & & \end{pmatrix}}_{\equiv X} \begin{pmatrix} D_{i_2 \dots i_P} \\ D_{1i_2 \dots i_P} \\ D_{2i_2 \dots i_P} \\ D_{3i_2 \dots i_P} \end{pmatrix} = \begin{pmatrix} \text{const.} \times D_{00i_2 \dots i_P} \\ -2 \sum_{r=2}^P \delta_{1i_r} D_{00i_2 \dots \hat{i}_r \dots i_P} \\ -2 \sum_{r=2}^P \delta_{2i_r} D_{00i_2 \dots \hat{i}_r \dots i_P} \\ -2 \sum_{r=2}^P \delta_{3i_r} D_{00i_2 \dots \hat{i}_r \dots i_P} \end{pmatrix} + C's$$

↪ recursive reduction of coefficients $D_{i_1 i_2 \dots i_P}$ from $D_{00i_2 \dots i_P}$

Basis integral $D_{\underbrace{0 \dots 0}_{2P > 2}}$ can be safely done numerically in Feynman-parameter space:

$$\text{e.g. for } P = 3: \quad D_{000000} = D_{000000} \Big|_{\text{UV-div}} - \frac{1}{8} \int_{\sigma_3} d^3x (A + 1) \ln(A - i\epsilon)$$

$A = \text{quadratic form in Feynman parameters } x_i$

Reduction with modified Cayley determinants up to rank 2: **step 0**

Reduction with modified Cayley determinants up to rank 2: **step 1b**

Reduction with modified Cayley determinants up to rank 2: **step 2a**

Reduction with modified Cayley determinants up to rank 2: **step 2b**

Reduction with modified Cayley determinants up to rank 2: **step 2c**

A typical example with small Gram determinant:

Box integral

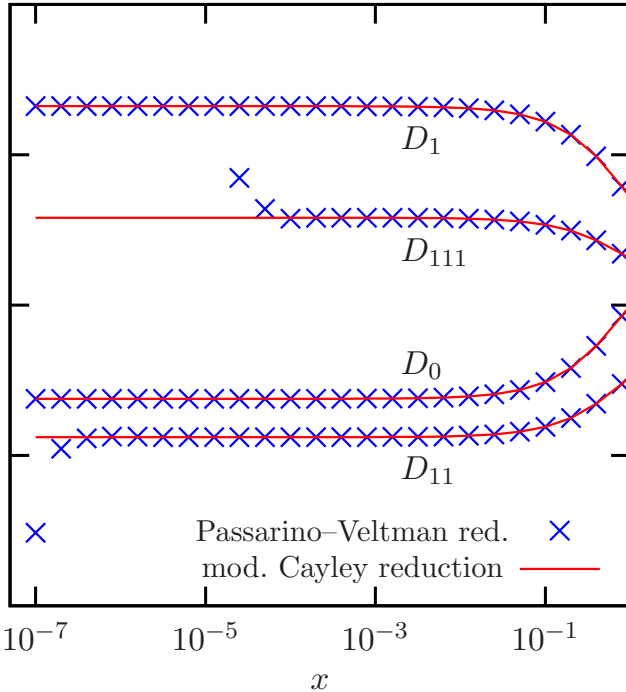

appears, e.g., in subgraph of diagram

Gram det.: $\det(Z) \rightarrow 0$ if $t_{e\bar{d}} \rightarrow t_{\text{crit}} \equiv \frac{s_{\mu\bar{\nu}u}(s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}u} - s_{\bar{\nu}u}}$

Numerical comparison:

Absolute prediction

Relative deviation

$x \equiv \frac{t_{e\bar{d}}}{t_{\text{crit}}} - 1$

$s_{\mu\bar{\nu}u} = +2 \times 10^4 \text{ GeV}^2$
 $s_{\bar{\nu}u} = +1 \times 10^4 \text{ GeV}^2$
 $t_{\bar{e}\mu} = -4 \times 10^4 \text{ GeV}^2$
 $t_{\text{crit}} = -6 \times 10^4 \text{ GeV}^2$

PV reduction breaks down, but mod. Cayley red. stable for $\det(Z) \rightarrow 0$!

Comments:

- Basis integral $D_{0\dots 0}$ enters with prefactor $\propto \frac{\det(Z)}{\det(X)}$
 - ↪ impact of $D_{0\dots 0}$ and of its numerical error suppressed for small $\det(Z)$
- **Limitation:** reduction involves inverse matrix X^{-1}
 - ↪ **potential instability if modified Cayley determinant $\det X \rightarrow 0$**
($\det X = 0$ is necessary condition for Landau singularity)
- If appropriate [for small $\det(X)$] more coefficients (D_{0000} , D_{0000i} , etc.) can be evaluated numerically
 - ↪ **accumulation of instabilities can be somewhat suppressed**

4 Expansion methods for 3- and 4-point integrals

4.1 Expansion for small Gram determinant

PV relations rewritten again:

$$\tilde{X}_{0j} D_{i_1 \dots i_P} = 2 \sum_{n=1}^{N-1} \tilde{Z}_{jn} \sum_{r=1}^P \delta_{ni_r} D_{00i_1 \dots \hat{i}_r \dots i_P} + \det(Z) D_{ji_1 \dots i_P} + C's$$

$$\begin{aligned} \tilde{Z}_{kl} D_{00i_1 \dots i_P} &\propto \sum_{n,m=1}^{N-1} \tilde{\tilde{Z}}_{(kn)(lm)} \left[f_n f_m D_{i_1 \dots i_P} + 2 \sum_{r=1}^P (f_n \delta_{mi_r} + f_m \delta_{ni_r}) D_{00i_1 \dots \hat{i}_r \dots i_P} \right. \\ &\quad \left. + 4 \sum_{\substack{r,s=1 \\ r \neq s}}^P \delta_{ni_r} \delta_{mi_s} D_{0000i_1 \dots \hat{i}_r \dots \hat{i}_s \dots i_P} \right] + 2m_0^2 \tilde{Z}_{kl} D_{i_1 \dots i_P} - \det(Z) D_{kli_1 \dots i_P} + C's \end{aligned}$$

\tilde{X} , \tilde{Z} , $\tilde{\tilde{Z}}$ = minors (subdeterminants) of X and Z (j, k, l chosen appropriately)

↪ Coefficients $\underbrace{D_{ij\dots}}_{\text{rank } P}$ and $\underbrace{D_{00i\dots}}_{\text{rank } P+1}$ from lower-rank terms $\underbrace{D_{ij\dots}}_{\text{rank } P-1}$ and $\underbrace{D_{00i\dots}}_{\text{rank } P}$
 up to suppressed higher-rank terms $\det(Z) \underbrace{D_{ij\dots}}_{\text{rank } P+1}$

↪ Equations suited for iteration for small $\det(Z)$:

D 's directly from C 's up to terms suppressed by $\det(Z)$

Expansion for small Gram determinant: **step 0**

$$D_0^{(0)}$$

$$D_i$$

$$D_{ij}$$

$$D_{ijk}$$

$$D_{ijkl}$$

$$\vdots$$

starting point: all D tensors = 0

$$D_{00}$$

$$D_{00i}$$

$$D_{00ij}$$

$$\vdots$$

$$D_{0000}$$

$$\vdots$$

Expansion for small Gram determinant: **step 1a**

Expansion for small Gram determinant: **step 1b**

Expansion for small Gram determinant: **step 1.0**

Expansion for small Gram determinant: **step 2a**

Expansion for small Gram determinant: **step 2b**

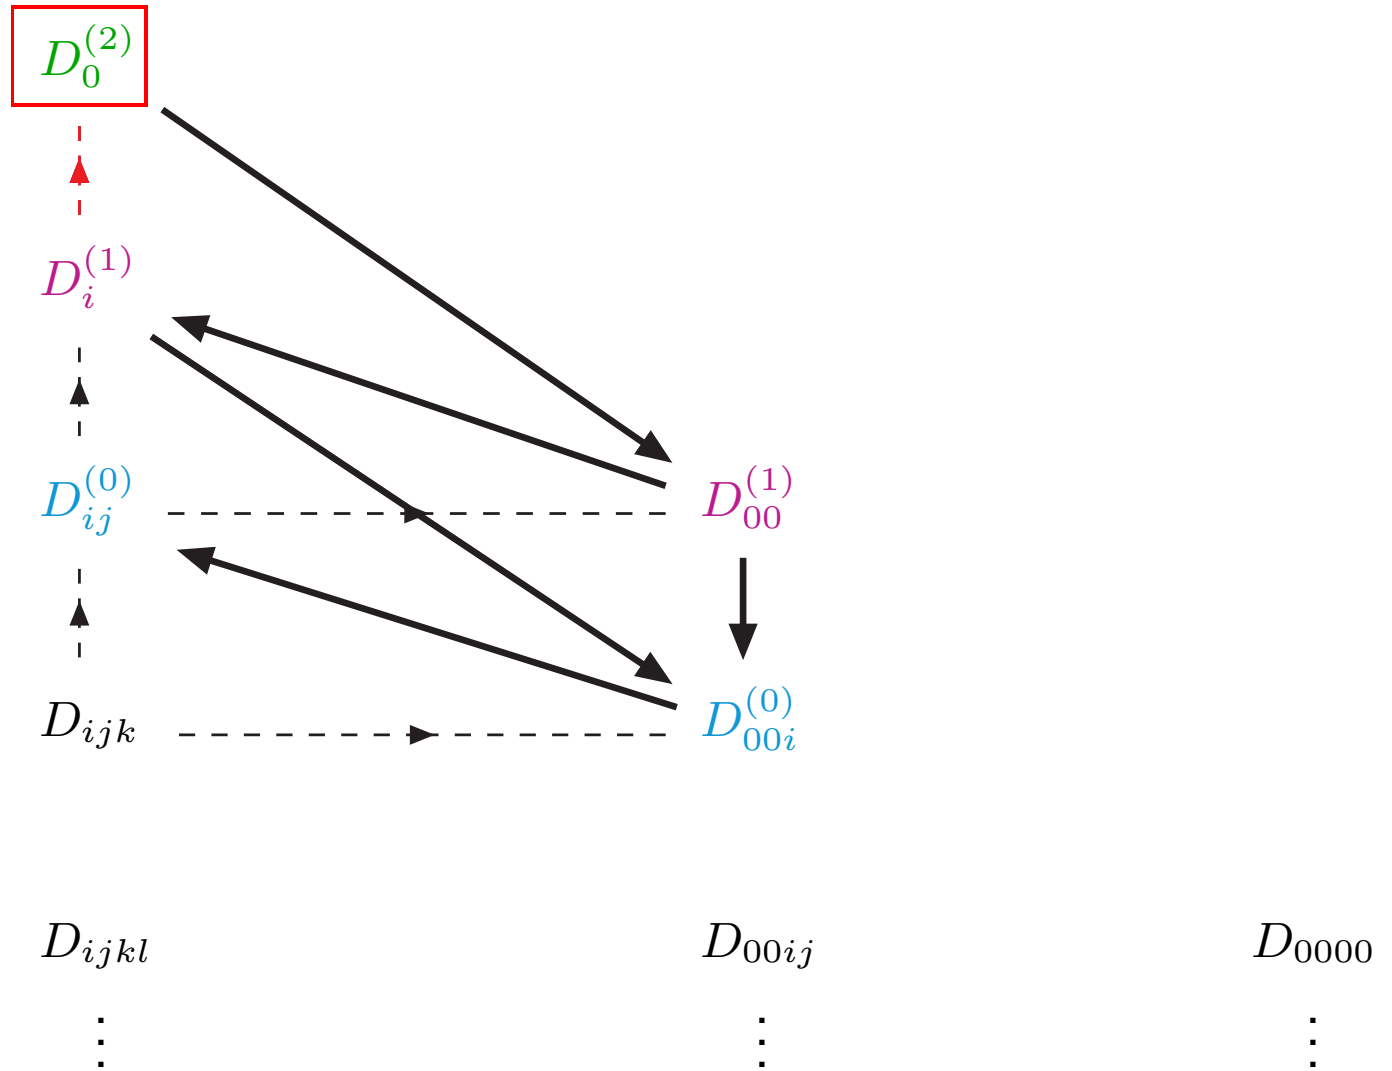

Expansion for small Gram determinant: **step 2.1a**

Expansion for small Gram determinant: **step 2.1b**

Expansion for small Gram determinant: **step 2.0**

Expansion for small Gram determinant: **step 3a**

Expansion for small Gram determinant: **step 3b**

Expansion for small Gram determinant: **step 3c**

Expansion for small Gram determinant: **step 3.2a**

Expansion for small Gram determinant: **step 3.2b**

Expansion for small Gram determinant: **step 3.1a**

Expansion for small Gram determinant: **step 3.1b**

Expansion for small Gram determinant: **step 3.0**

A typical example with small Gram determinant: (same as above)

Box integral

appears, e.g., in subgraph of diagram

Gram det.: $\det(Z) \rightarrow 0$ if $t_{e\bar{d}} \rightarrow t_{\text{crit}} \equiv \frac{s_{\mu\bar{\nu}u}(s_{\mu\bar{\nu}u} - s_{\bar{\nu}u} + t_{\bar{e}\mu})}{s_{\mu\bar{\nu}u} - s_{\bar{\nu}u}}$

Numerical comparison:

$x \equiv \frac{t_{e\bar{d}}}{t_{\text{crit}}} - 1$

$s_{\mu\bar{\nu}u} = +2 \times 10^4 \text{ GeV}^2$
 $s_{\bar{\nu}u} = +1 \times 10^4 \text{ GeV}^2$
 $t_{\bar{e}\mu} = -4 \times 10^4 \text{ GeV}^2$
 $t_{\text{crit}} = -6 \times 10^4 \text{ GeV}^2$

PV reduction breaks down, but Gram exp. stable for $\det(Z) \rightarrow 0$!

Comments:

- Indices j, k, l of \tilde{X}_{0j} and \tilde{Z}_{kl} can be chosen to optimize stability
- For $e^+e^- \rightarrow 4f$ iteration up to step 5 was sufficient, but number of iterations not restricted
- Iteration does not converge if
 - ◇ either all \tilde{Z}_{kl} are small
happens most frequently if $Z \rightarrow 0$
 \hookrightarrow new expansion about $Z \rightarrow 0$ possible (worked out!)
 - ◇ or all \tilde{X}_{0j} are small [which implies $\det(X) \rightarrow 0$]
 \hookrightarrow new double expansion in small $\det(Z)$ and \tilde{X}_{0j} (described next!)

4.2 Expansion for small Gram and modified Cayley determinants

PV relations rewritten again:

$$\sum_{n=1}^{N-1} \tilde{Z}_{kn} \sum_{r=1}^P \delta_{ni_r} D_{00i_1 \dots \hat{i}_r \dots i_P} \propto \tilde{X}_{k0} D_{i_1 \dots i_P} - \det(Z) D_{ki_1 \dots i_P} + C's,$$

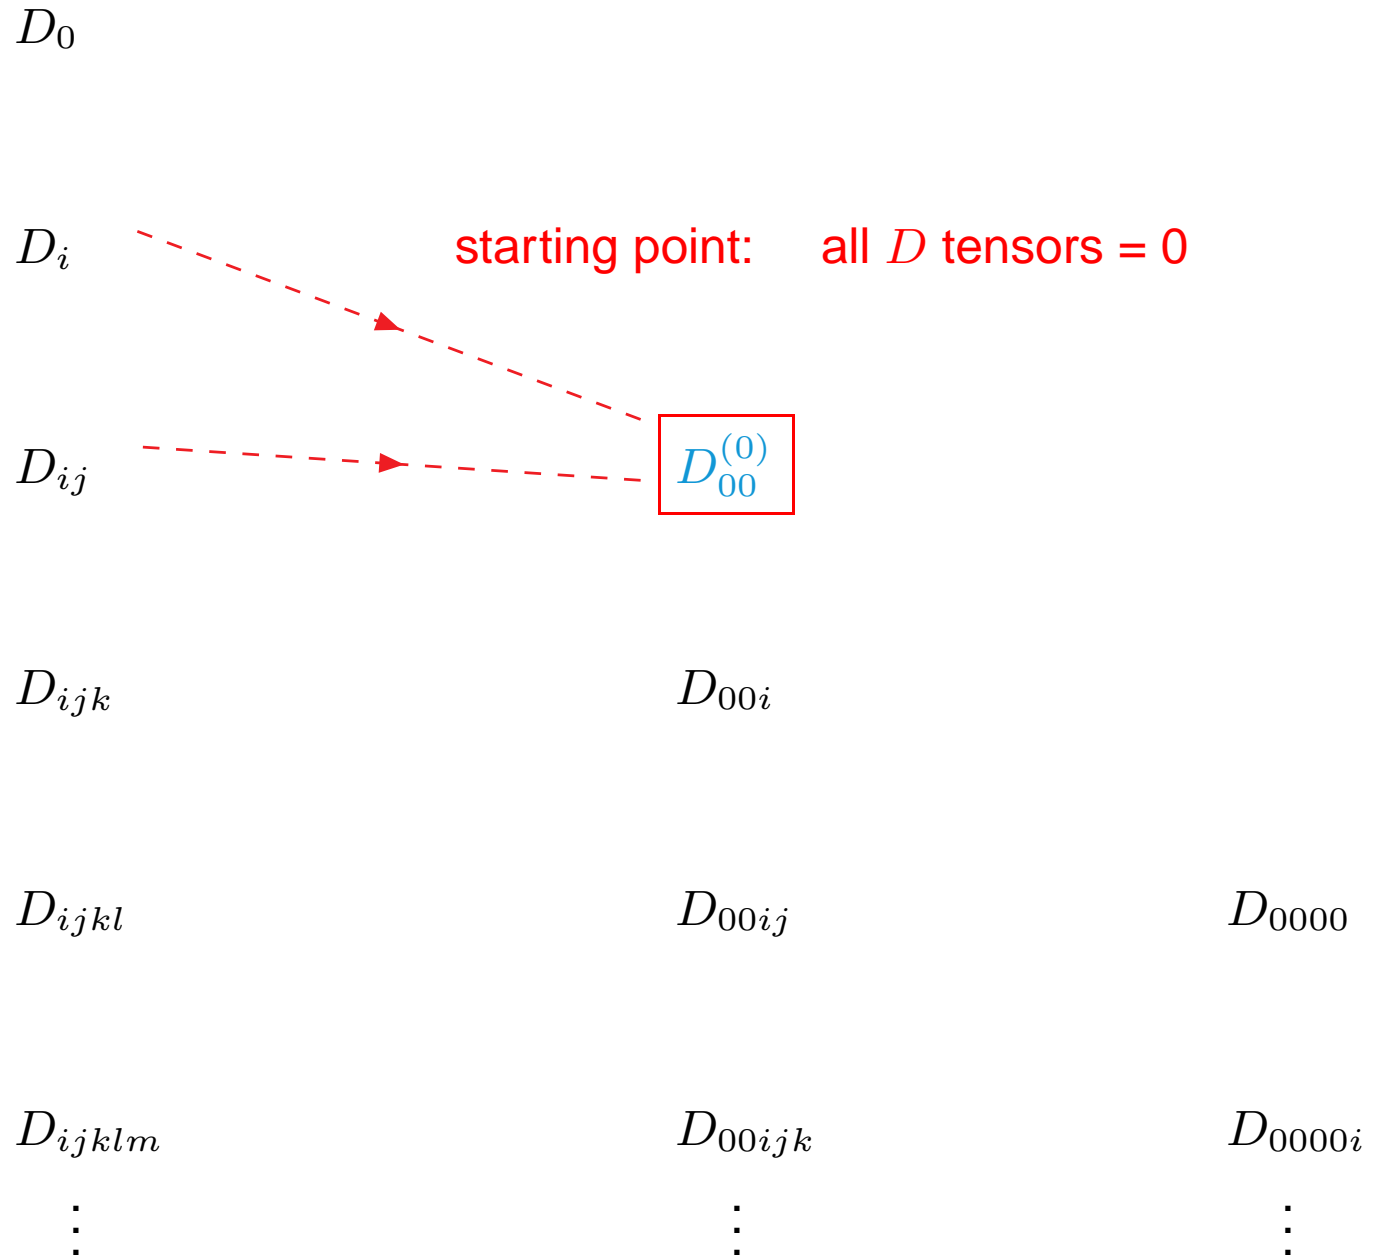

$$\begin{aligned} \tilde{X}_{ij} D_{i_1 \dots i_P} = \text{const.} \times \tilde{Z}_{ij} D_{00i_1 \dots i_P} - 2 \sum_{m,n=1}^{N-1} \tilde{Z}_{(in)(jm)} f_n \sum_{r=1}^P \delta_{mi_r} D_{00i_1 \dots \hat{i}_r \dots i_P} \\ + \tilde{X}_{0j} D_{ii_1 \dots i_P} + C's \end{aligned}$$

↪ Coefficients $\underbrace{D_{00ij\dots}}_{\text{rank } P}$ from C 's up to suppressed terms $\underbrace{D_{ij\dots}}_{\text{rank } P}$ and $\underbrace{D_{j\dots}}_{\text{rank } P-1}$

Coefficients $\underbrace{D_{ij\dots}}_{\text{rank } P}$ from $\underbrace{D_{00j\dots}}_{\text{rank } P+1}$ and $\underbrace{D_{00ij\dots}}_{\text{rank } P+2}$
up to suppressed higher-rank terms $\underbrace{D_{ijk\dots}}_{\text{rank } P+1}$

↪ Equations suited for iteration for small $\det(Z)$ and \tilde{X}_{0j} :
 D 's directly from C 's up to terms suppressed by $\det(Z)$ or \tilde{X}_{0j}

Expansion for small Gram and modified Cayley determinants: **step 0a**

Expansion for small Gram and modified Cayley determinants: **step 0b**

Expansion for small Gram and modified Cayley determinants: **step 0c**

Expansion for small Gram and modified Cayley determinants: **step 0d**

Expansion for small Gram and modified Cayley determinants: **step 1a**

Expansion for small Gram and modified Cayley determinants: **step 1b**

Expansion for small Gram and modified Cayley determinants: **step 1c**

Expansion for small Gram and modified Cayley determinants: **step 1d**

Expansion for small Gram and modified Cayley determinants: **step 1e**

Expansion for small Gram and modified Cayley determinants: **step 1f**

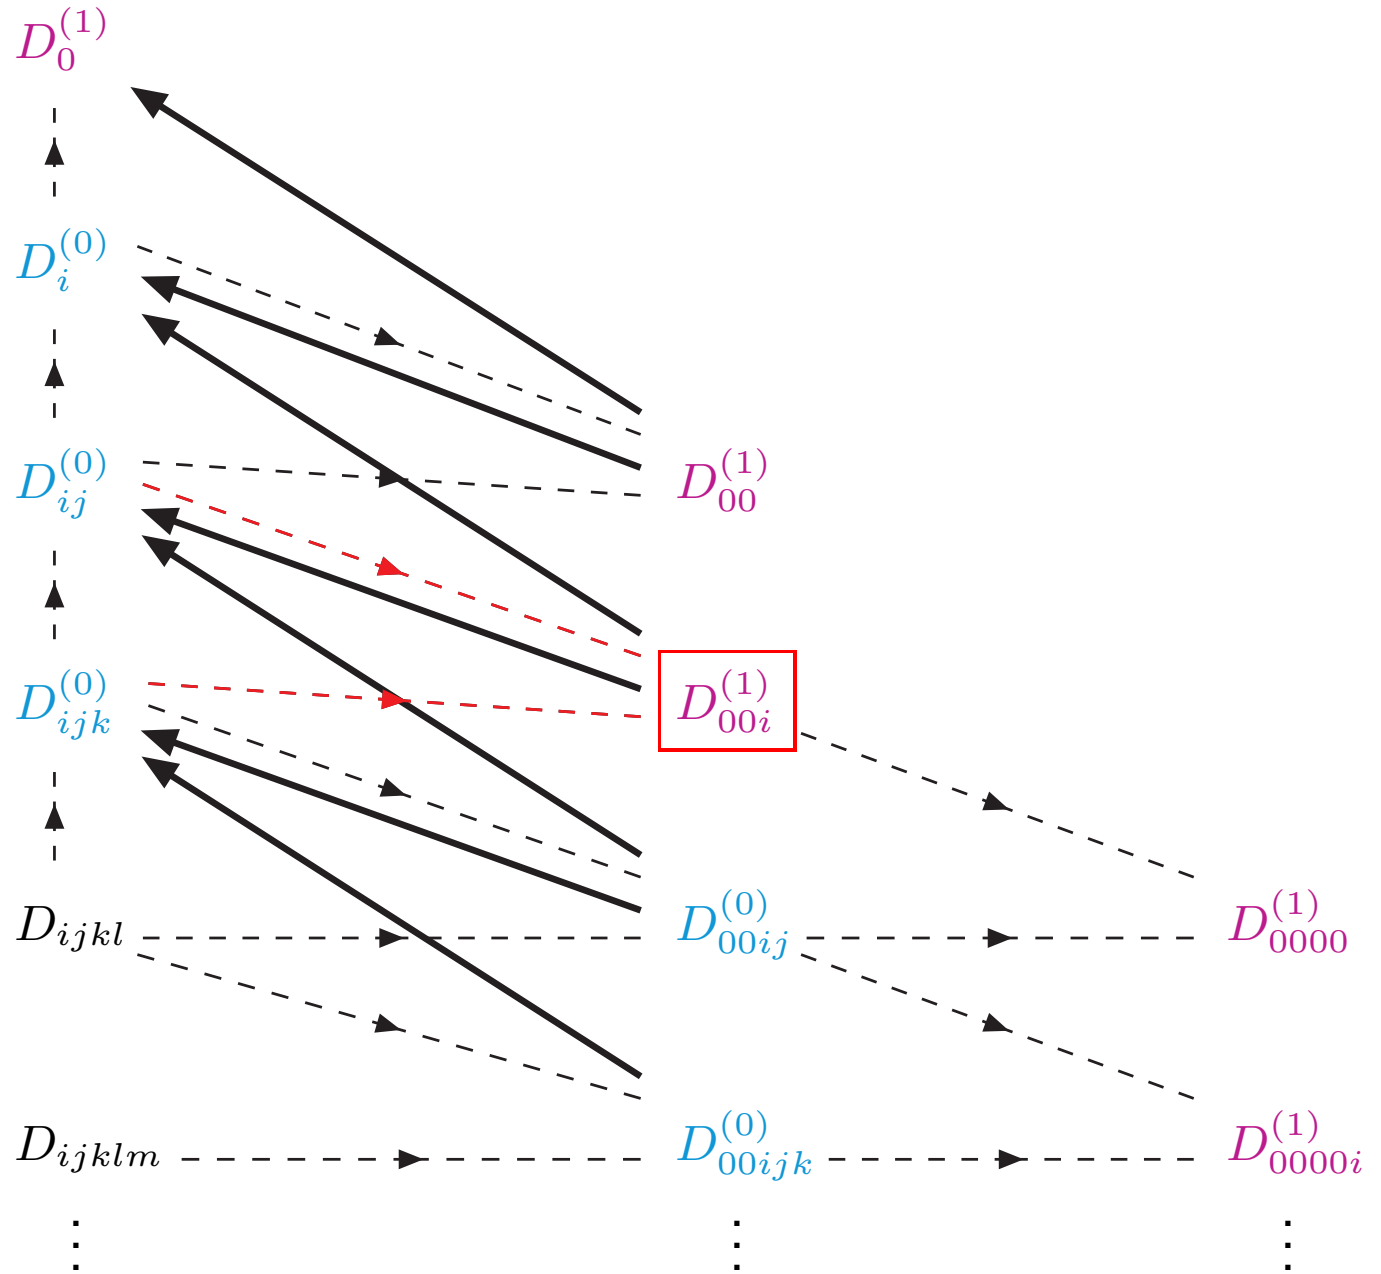

Expansion for small Gram and modified Cayley determinants: **step 1.0a**

Expansion for small Gram and modified Cayley determinants: **step 1.0b**

Expansion for small Gram and modified Cayley determinants: **step 1.0c**

Expansion for small Gram and modified Cayley determinants: **step 1.0d**

A very delicate example with small Gram and mod. Cayley determinants:

Box integral

appears, e.g., in subgraph of diagram

Gram det.: $\det(Z), \det(X) \rightarrow 0$ if $s_{\mu\bar{\nu}d} \rightarrow s$ and $s_{\mu\bar{\nu}u} \rightarrow s_{\mu\bar{\nu}}$

Numerical comparison:

$$x \equiv \frac{s_{\mu\bar{\nu}d}}{s} - 1$$

$$\equiv \frac{s_{\mu\bar{\nu}u}}{s_{\mu\bar{\nu}}} - 1$$

$$s = 4 \times 10^4 \text{ GeV}^2$$

$$s_{\mu\bar{\nu}} = 64 \times 10^2 \text{ GeV}^2$$

PV reduction breaks down,
but Gram/Cayley exp. stable
for $\det(Z), \det(X) \rightarrow 0$!

5 Reduction schemes for 5- and 6-point integrals

General idea: reduce a determinant that is zero in 4 space–time dimensions
 \hookrightarrow relation between 5-(6-)point and 4-(5-)point integrals

5.1 5-point integrals

Starting point:

$$\int \mathcal{E} = \frac{(2\pi\mu)^{4-D}}{i\pi^2} \int d^D q \frac{q^{\mu_1} \dots q^{\mu_P}}{N_0 N_1 \dots N_4} \begin{vmatrix} q^\mu & -2q^2 & 2qp_1 & \dots & 2qp_4 \\ 0 & 2m_0^2 & f_1 & \dots & f_4 \\ p_1^\mu & -2p_1q & 2p_1p_1 & \dots & 2p_1p_4 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ p_4^\mu & -2p_4q & 2p_4p_1 & \dots & 2p_4p_4 \end{vmatrix}$$

$$= 2m_0^2 \det(Z) (g_\alpha^\mu - g_{(4)\alpha}^\mu) E^{\alpha\mu_1 \dots \mu_P}$$

$$+ 2 \sum_{n=1}^4 \tilde{X}_{n0} \left[p_n^\mu \left(\underbrace{g_{\alpha\beta}}_{D\text{-dim}} - \underbrace{g_{(4)\alpha\beta}}_{4\text{-dim (built of momenta)}} \right) - p_{n,\beta} (g_\alpha^\mu - g_{(4)\alpha}^\mu) \right] E^{\alpha\beta\mu_1 \dots \mu_P}$$

$$= \begin{cases} \mathcal{O}(D-4) & \text{for } P \leq 3 \\ \text{finite, but simply calculable} & \text{for } P > 3 \end{cases}$$

Reduction of determinant in momentum space (simple manipulations)

↪ propagator cancellations lead to 4-point integrals

$$\begin{aligned} \int \mathcal{E} = & \det(X) E^{\mu\mu_1\dots\mu_P} - \sum_{n,m=1}^4 \tilde{X}_{mn} p_m^\mu \left[D^{\mu_1\dots\mu_P}(n) - D^{\mu_1\dots\mu_P}(0) \right] \\ & - \sum_{n=1}^4 \tilde{X}_{n0} \left[-p_n^\mu D^{\mu_1\dots\mu_P}(0) + \mathcal{D}^{\mu\mu_1\dots\mu_P}(n) \right] \\ & + \sum_{n=1}^4 \mathcal{D}^{\alpha\mu_1\dots\mu_P}(n) \sum_{m,l=1}^4 2p_{m,\alpha} p_l^\mu \tilde{X}_{(ln)(0m)} \end{aligned}$$

(similar result recently obtained by [Binoth et al. '05](#))

↪ Tensor coefficients $E\dots$ read off upon comparing coefficients of covariants

Comments:

- reduction of rank: $E^{\mu\mu_1\dots\mu_P} \rightarrow \text{rank}(P+1)$
 $D\text{'s} / \mathcal{D}\text{'s} \rightarrow$ directly obtained from **rank- P** integrals
- **no inverse Gram determinant**, but $E^{\mu\mu_1\dots\mu_P} = [\dots] / \det(X)$
- reduction works for **massive/massless case in any IR regularization**

Explicit results for 5-point tensor coefficients:

$$\det(X)E_{i_1} = \sum_{n=1}^4 \tilde{X}_{i_1 n} \left[D_0(n) - D_0(0) \right] - \tilde{X}_{i_1 0} D_0(0),$$

$$\det(X)E_{00} = \sum_{n=1}^4 \tilde{X}_{n0} \left[D_{00}(n) - D_{00}(0) \right],$$

$$2 \det(X)E_{i_1 i_2} = \left\{ \sum_{n=1}^4 \tilde{X}_{i_1 n} \left[D_{(i_2)_n}(n) \bar{\delta}_{i_2 n} - D_{i_2}(0) \right] - \tilde{X}_{i_1 0} D_{i_2}(0) \right. \\ \left. - 2 \sum_{n=1}^4 \tilde{X}_{(i_1 n)(0 i_2)} \left[D_{00}(n) - D_{00}(0) \right] \right\} + (i_1 \leftrightarrow i_2),$$

etc., **explicitly worked out up to rank 5**

Scalar integral via method of **Melrose '65** (Denner '93; Denner, S.D. '02):

$$\det(X)E_0 = - \sum_{n=0}^4 \det(Y_n) D_0(n), \quad Y_n = \text{kinematical matrices related to } X$$

5.2 6-point integrals

Starting point:

$$\int \mathcal{F} = \frac{(2\pi\mu)^{4-D}}{i\pi^2} \int d^D q \frac{q^{\mu_1} \dots q^{\mu_P}}{N_0 N_1 \dots N_5}$$

$$\begin{vmatrix} q^\mu & 2qp_1 & \dots & 2qp_5 \\ p_1^\mu & 2p_1p_1 & \dots & 2p_1p_5 \\ \vdots & \vdots & \ddots & \vdots \\ p_{k-1}^\mu & 2p_{k-1}p_1 & \dots & 2p_{k-1}p_5 \\ 0 & f_1 & \dots & f_5 \\ p_{k+1}^\mu & 2p_{k+1}p_1 & \dots & 2p_{k+1}p_5 \\ \vdots & \vdots & \ddots & \vdots \\ p_5^\mu & 2p_5p_1 & \dots & 2p_5p_5 \end{vmatrix}$$

$$= -\tilde{X}_{k0} F^{\alpha\mu_1 \dots \mu_P} (g_\alpha^\mu - g_{(4)}^\mu{}_\alpha)$$

$$= \begin{cases} \mathcal{O}(D-4) & \text{for } P \leq 6 \\ \text{finite, but simply calculable} & \text{for } P > 6 \end{cases}$$

Reduction of determinant in momentum space

$$\int \mathcal{F} = -\tilde{X}_{k0} F^{\mu\mu_1 \dots \mu_P} - \sum_{n,m=1}^5 \tilde{X}_{(km)(0n)} p_m^\mu \left[E^{\mu_1 \dots \mu_P}(n) - E^{\mu_1 \dots \mu_P}(0) \right]$$

(index k can be chosen to optimize stability)

↪ reduction of rank and applicability for arbitrary IR regularization as in 5-pt case

Explicit results for 6-point tensor coefficients:

$$F_{i_1} = \sum_{n=1}^5 c_{i_1 n} \left[E_0(n) - E_0(0) \right],$$

$$F_{00} = 0,$$

$$F_{i_1 i_2} = \frac{1}{2} \sum_{n=1}^5 \left\{ c_{i_1 n} \left[E_{(i_2)_n}(n) \bar{\delta}_{i_2 n} - E_{i_2}(0) \right] + (i_1 \leftrightarrow i_2) \right\},$$

$$F_{00 i_1} = \frac{1}{3} \sum_{n=1}^5 c_{i_1 n} \left[E_{00}(n) - E_{00}(0) \right],$$

$$F_{i_1 i_2 i_3} = \frac{1}{3} \sum_{n=1}^5 \left\{ c_{i_1 n} \left[E_{(i_2)_n (i_3)_n}(n) \bar{\delta}_{i_2 n} \bar{\delta}_{i_3 n} - E_{i_2 i_3}(0) \right] + (i_1 \leftrightarrow i_2) + (i_1 \leftrightarrow i_3) \right\},$$

etc., $c_{i_1 n}$ = related to inverse matrix X^{-1}

Scalar integral via method of Melrose '65 (Denner '93):

$$\det(X) F_0 = - \sum_{n=0}^5 \det(Y_n) E_0(n), \quad Y_n = \text{kinematical matrices related to } X$$

6 Conclusions

NLO corrections to $2 \rightarrow 4$ processes are now feasible

- preliminary NLO EW results for $e^+e^- \rightarrow \nu\bar{\nu}HH$ GRACE-loop '04/'05
- complete NLO EW results for $e^+e^- \rightarrow 4$ fermions (CC) Denner, S.D., Roth, Wieders, '05

Techniques described in this talk successfully applied to $e^+e^- \rightarrow 4f$

- 1- and 2-point integrals \rightarrow stable direct calculation
- 3- and 4-point integrals \rightarrow two hybrid methods
 - (i) Passarino–Veltman \oplus seminumerical method \oplus analytical special cases
 - (ii) Passarino–Veltman \oplus expansions in small Gram and other kin. determinants
- 5- and 6-point integrals
 - \hookrightarrow stable reduction to lower-point integrals without Gram determinants

\Rightarrow Techniques ready for further applications

(dim. regularization for IR singularities possible; complex masses supported)

Practical experience

- Phase-space integration reveals weaknesses of methods.
- **Power + reliability of techniques can only be assessed via non-trivial applications !**
